

Win-Test EU-HF Championship Contest database

Updated: July 24, 2024

ZIP file contains 2 files:

- "EU_HF.dtb" (callsigns and last two digits of the year of operator's first ever official amateur radio license)
- "README.pdf" file (this help file)

The "EU_HF.dtb" database drives the exchange guessing feature of Win-Test. If exchange guessing is enabled and when a callsign of a station included in the database is entered its last two digits of the year of operator's first license will be automatically retrieved. Also the Check Partial window can show the same information if it has been enabled by checking the display exchange option in the context menu. Win-Test will load database automatically if "EU_HF.dtb" file is available and EU-HF Championship Contest is selected. Just copy / replace "EU_HF.dtb" into your /databases directory. To locate this directory use File / Explore / Databases directory (**Win-Test version v4 only**) or save database file in

Windows XP: C:\Documents and Settings\All Users\Application Data\Win-Test\databases\

Windows Vista & Windows 7: C:\ProgramData\Win-Test\databases\

For **Win-Test version v3**, save database file in

C:\Program Files\Win-Test\ (or the Win-Test installation directory)

EU_HF.dtb is a binary format and is not editable!

Just remember! Log what you heard, not what a database tells you that you might have heard. If you didn't hear it, don't log it. Exchange guessing feature is not a replacement for your ears!
